

Skinshine Cream is used in the treatment of melasma. It helps in quick skin renewal. It provides relief from redness, swelling, and itching.

USES OF SKINSHINE CREAM

- Treatment of Melasma

BENEFITS OF SKINSHINE CREAM

In Treatment of Melasma

Melasma is a common skin problem that causes dark, discolored patches on your skin. It is more commonly seen in females than males. Skinshine Cream helps to lighten these dark patches of the skin usually caused by pregnancy, birth control pills, hormone medicine, or injury to the skin. It effectively blocks that process in the skin that leads to discoloration. Skinshine Cream also reduces any redness, rash, pain or itchiness that may be caused in this condition.

This improves your self-esteem and confidence as your appearance changes. You should always use it as prescribed and only apply the amount you have been told to. Keep using it for as long as it is prescribed to get the full benefits.

HOW SKINSHINE CREAM WORKS

Skinshine Cream is a combination of three medicines: Hydroquinone, Mometasone and Tretinoin, which treats melasma (dark spots on skin). Hydroquinone is a skin lightening medicine. It reduces the amount of a skin pigment (melanin) that causes darkening of skin. This effect is reversible. Mometasone is a steroid which blocks the production of certain chemical messengers (prostaglandins) that make the skin red, swollen and itchy. Tretinoin is a form of vitamin A that helps the skin to renew itself more quickly.
