

Melalite Forte Hydroquinone 4 Cream is used in the treatment of melasma. It is a skin-lightening medicine that lightens the darkened skin patches and spots(hyperpigmentation). It reduces the amount of skin-darkening pigment called melanin in the skin. It helps in reversible depigmentation of the skin.

## **USES OF MELALITE FORTE CREAM**

- Melasma

## **BENEFITS OF MELALITE FORTE CREAM**

### **In Melasma**

Melasma is a common skin problem that causes dark, discolored patches on your skin. It is more commonly seen in females than males. Melalite Forte Cream helps to lighten these dark patches of the skin usually caused by pregnancy, birth control pills, hormone medicine, or injury to the skin. It effectively blocks that process in the skin that leads to discoloration. Melalite Forte Cream also reduces any redness, rash, pain, or itchiness that may be caused by this condition.

This improves your self-esteem and confidence as your appearance changes. You should always use it as prescribed and only apply the amount you have been told to. Keep using it for as long as it is prescribed to get the full benefits.

## **HOW MELALITE FORTE CREAM WORKS**

Melalite Forte Cream is a skin lightening medication. It works by reducing the amount of a pigment (melanin) that causes darkening of skin. It does so by suppressing the activity of tyrosinase, the enzyme required to make melanin.
